## About us

- Provide research, development, design and consultancy services:
  - Autonomous Vehicles (Underwater, ground and aerial).
  - Laser and Vision Navigation and Mapping/Survey systems.
  - Autonomous Vehicle control and fly-by-wire systems.
- Applying autonomous solutions and ideas to road/rail to improve transport as whole and help *enable the disabled*

## What we can offer

**Been stuck with no Tube recently?**

**We have the solution.**

.Autonomous technology research, development and deployment in your domain (Road/Rail Crossover)

.Innovative solutions and feasibility proof-of-concepts

.Project management

.Consortium lead or partner

## What or who we are seeking

Existing transport network operators / manufacturers with an interest in improving their service and interested in exploring what different types of autonomous/semi-autonomous systems can offer, thus reducing infrastructure costs etc

## What's your innovation/idea

•To target new transport installations and provide them with smart control systems which can initially aid an existing operator/driver and then be switched to full-autonomy. Enabling the disabled with real end-to-end assistive technology.

## What's the market opportunity you are addressing

•Bridging the gap between existing rail systems and the human piloted Taxi. Providing the flexibility of the Taxi without rail infrastructure requirements, but with the efficiency of a dedicated train/tram.
