Event Information:

ABI predicts that by 2020 sensors will account for over 60 percent of the total installed base of the 30 billion devices in the *Internet of Things*. There are various layers of technology involved in the Internet of Things, and this event (which is the Sensor and Instrumentation Communities flagship networking event) aims to explore the role of sensors.

Topics to cover

- Connectivity – how are sensor devices integrated together
- Energy Harvesting – how can devices be powered
- Creating actionable intelligence – how can the integration of multiple devices provide actionable intelligence to provide information greater than the sum of the individual parts

There are opportunities for developers of technology in the above fields to exhibit at ISP42, If you are interested in this please contact matt.butchers@ktn-uk.org
